IN THE SPECIFICATION:

Please amend the following paragraphs as indicated:

Paragraph beginning on page 14, line 7:

(6) Sequence number: This field indicates when a change has occurred in the Download Control Message. For example, if [[an]] a Download Control Message is received with auto enable not activated, the set-top terminal (102) will download all specified code objects, but it will not enable the objects. Rather, the terminal (102) waits for a subsequent Download Control Message containing the same list and version of objects to be acquired with the auto enable flag set. The sequence number field would be used to indicate that the Message had changed, and that the set-top terminal (102) should process the Message.

Paragraph beginning on page15, line 5:

(11) Download channel field: This field specifies the channel that the set-top terminal (102) should tune to acquire the download object or objects specified in the Download Control Message. The download channel field provides the reference from which the download PID may be determined. The download channel field may refere refer to an entry in the Virtula Virtual Channel Table (VCT). From that table, the download PID specifying the packets of the object to be acquired can be determined.
